★直流无刷电机简介

(Brief Introduction of DC Brushless Motor)

无刷电机使用电子换向，其特点是具有良好的转矩特性、高功率、极宽的调速范围，以及其无与伦比的使用寿命。

The electronically commutated motor are the characterized especially by their favorable torque characteristics, high power, extremely broad speed range and of cause by their unsurpassed service life.

★无刷电机原理 (Principles of operation)

直流无刷电机与直流有刷电机的机械换向的区别在于

The differences between a DC motor having a mechanical commutation system and a BLDC motor are mainly found in:

- 产品概念 The product concept
- 相电流换向 The commutation of phase currents.

从使用者角度来看，直流无刷电机与直流有刷电机机械特性基本相同：转矩与电流成正比，转速取决于电压和负载转矩。

From the user's point of view, DC brushless motors follow the same equations as those with brushes: torque is proportional to current, speed depends on the voltage and the load torque.

★无刷电机的换向 (The commutation of brushless motors)

传统直流有刷电机都是通过换向器与电刷之间进行机械换向。在无刷电机中是通过电子手段实现换向。在电子换向过程中必须知道瞬时转子的位置，以确定要通电的相位。

In the conventional DC motor commutation takes place mechanically through the commutator-and-brush system. In a BLDC motor, commutation is done by electronic means. In that case the instantaneous rotor position must be known in order to determine the phases to be energized.

转子的角度位置可以通过如下方式获得：

The angular rotor position can be known by:

- 使用位置传感器(霍尔元件、光学编码器、旋转变压器)
Using a position sensor (Hall sensor, optical encoder, resolver)
- 无位置传感换向，使用电子分析计算绕组反电势过0点位置。Electronically analyzing the back-EMF of a non-energized winding. This is called sensorless commutation.

★霍尔元件的使用 (Use of Hall sensors)

一般无刷电机有三相绕组，一次通电两相绕组，最简单常用的方式就是使用霍尔元件确定转子的位置。与有刷电机中的碳刷和换向器一样，无刷电机是通过简单的逻辑计算知道转子的位置并通知相绕组换向。

In general, BLDC motor have three phase windings. The easiest way is to power two of them at a time, using Hall sensors to know the rotor position. A simple logic allows for optimal energizing of the phases as a function of rotor position, just like the commutator and brushes are doing in the conventional DC motor.

★编码器或旋转变压器的使用

(Use of an encoder or resolver)

转子位置也可以通过编码器或旋转变压器来知道。换向可以非常简单地完成，类似于霍尔传感器的程序，或者通过在三相中调节正弦电流来完成更复杂的程序。这被称为矢量控制，其优点是提供理论零转矩脉动，以及精确定位的高分辨率。

The rotor position may also be known by use of an encoder or resolver. Commutation may be done very simply, similar to the procedure with Hall sensors, or it may be more complex by

modulating sinusoidal currents in the three phases. This is called vector control, and its advantage is to provide a torque ripple of theoretically zero, as well as a high resolution for precise positioning.

★反电势分析使用 (Use of Back-EMF analysis)

第三种方式不需要位置传感器，但是需要特殊电子电路设计支持。电机仅仅只有三根相线引出线，三相可以是三角形或星形连接方式。这种情况下，必须参考电压过0点来确认换向时刻。这类解决方案因为不需要传感器或电子元件，因此可以使用在极其恶劣的环境，对于手持式电动工具类应用，因为电缆需要不断移动，仅仅只有三根线也是很有优势的。

A third option requiring no position sensor is the use of a particular electronic circuit. The motor has only three hook-up wires, the three phase windings are connected in either triangle or star. In the latter case, resistors must be used to generate a zero reference voltage. With this solution the motor includes no sensors or electronic components and it is therefore highly insensitive to hostile environments. For applications such as hand-held tools, where the cable is constantly moved, the fact of just three wires is another advantage.

★直流无刷电机的损耗计算

(Loss calculation of BLDC motors)

无刷电机与一般直流电机一样使用相同的计算公式，但是在效率至关重要的场合，必须充分考虑到铁损和驱动电路损耗等参数。

It follows the same equations as the DC motor using mechanical commutation except that parameters like iron losses and losses in the drive circuit are no longer negligible in applications where efficiency is of prime importance.

★铁损耗 (Iron losses)

铁损耗与转速和转子的极数有关，转矩公式中可以作为粘性摩擦引入。电机有效转矩计算公式如下：

They depend on speed and motor poles, in the torque formula, may be introduced as viscous friction. The equation for useful motor torque becomes:

$$M_m = k I_m - k_v \omega - M_f$$

M_m = 电机有效转矩 Motor useful torque

k = 转矩常数 Torque constant

I_m = 电机电流 Motor current

k_v = 铁损粘性系数 Viscous coefficient for iron losses

ω = 角速度 Angular velocity

M_f = 轴承摩擦 Bearing friction

$$P_{tr} = P_h + P_{ec} + P_e$$

P_{tr} : 铁损 (Iron losses)

P_h : 磁滞损耗 (Hysteresis losses)

P_{ec} : 涡流损耗 (Eddy current losses)

P_e : 附加损耗 (Additional losses)

铁损跟磁场强度的平方成正比，跟频率的1.3—1.5次方成正比，频率=转速*极对数/60

The iron loss is proportional to the square of the magnetic field intensity, and the iron loss is proportional to the 1.3-1.5 power of the frequency. Frequency = Speed * Poles' pair/60

★电子损耗 (Losses in the electronics)

电机所需的电流、电压以及驱动电路所需要的在既定的转速和扭矩下运行都取决于驱动电路。例如，双极技术中的驱动桥将使电机终端的可用电压降低约1.7V，总电流必须包括电路的消耗。

The current and voltage required by the motor and the drive circuit to be operated at the desired speed and torque depend also on the drive circuit. As an example, a driver bridge in bipolar technique will reduce the voltage available at the motor terminals by about 1.7V, and the total current must include the consumption of the circuitry.

★建议 (Remember)

-带载启动运行场合，必须使用位置传感器换向。For commutation, position sensors are necessary when operating in incremental mode

-无位置传感建议使用在连续稳速或恒定负载的场合，譬如风扇类应用。Sensorless commutation is recommended only for applications running at constant speed and load such as fan applications.

★电机参数说明 (Indications Of Motor Data)

1: 额定电压 (Nominal Voltage) 单位 (Unit): 伏 (V)

额定电压是在电机绕组上电过程中，施加在各相之间的电压值。所有的额定参数均参考电压值。在一定限值之内，低一点、高一点电压都是可以工作的。

Nominal voltage is the applied voltage between powered phases in block commutation. All nominal data refer to this voltage. Lower and higher voltage are permissible, provided that limits are not exceeded.

2: 额定转矩 (Nominal Torque) 单位 (Unit): 牛·米 (N.m)

额定转矩是在电机25度条件下，在额定电压和额定电流情况下输出的扭矩，它受连续运行范围限制，超出额定转矩越大，电机发热越厉害。

Nominal Torque is the torque generated for operation at nominal voltage and nominal current at a motor temperature of 25°C. It is at the limit of the motor's continue operation range. Higher torques heat up the winding too much.

3: 额定转速 (Nominal Speed) 单位 (Unit): 转/分 (rpm)

额定转速是在电机25度条件下，在额定电压和额定转矩情况下运行设定的转速。

Nominal speed is the speed set for operation at nominal voltage and nominal torque at a motor temperature of 25°C.

4: 转矩常数 (Torque constant) 单位 (Unit): 牛·米/安培 (N.m/A)

转矩常数是单位电流产生的单位力矩，可以理解为转矩值与电流的比值。

This may also be referred to as specific torque and represents the quotient from generated torque and applicable current.

无框电机一般由定子总成和转子总成两部分组成。

定子总成包含定子铁芯、嵌入定子铁芯的铜绕组和 PCB 电路板, PCB 电路板作为绕组过线和 hall 传感器固定使用。hall 传感器可以感应转子位置, 为控制系统提供位置信号。hall 传感器信号端口可由接插端子引出。为提高定子总成的可靠性和使用寿命, 定子总成采用灌封胶进行了真空灌封。

转子总成通常由导磁环和永磁体组成。永磁体由根据具体工况采用对应的方

式固定在导磁环上。永磁体材料的选择将取决于应用要求, 可包括钕钴或钕铁硼。

Frameless motors generally consist of two parts: a stator assembly and a rotor assembly.

The stator assembly includes a stator core, a copper winding embedded in the stator core, and a PCB circuit board. The PCB circuit board is used as a winding wire and a hall sensor. The hall sensor can sense the rotor position and provide position signals for the control system. The hall sensor signal port can be led out by plug-in terminals. In order to improve the reliability and service life of the stator assembly, the stator assembly is vacuum potted with potting glue.

The rotor assembly is usually composed of a magnetic ring and permanent magnets. The permanent magnet is fixed on the permeable ring in a corresponding manner according to specific working conditions. The choice of permanent magnet material will depend on the application requirements and can include samarium cobalt or neodymium iron boron.
